PROFILE

I am an urban planner and software developer combining modern urban planning with advanced data automation and web technologies. My expertise spans enterprise GIS architecture, 3D smart city modelling and data engineering.

Using ArcGIS Enterprise and open-source web libraries, I build end-to-end enterprise applications that analyse and visualise planning, property and urban regeneration data, turning it into decision-support systems.

I use my technical skills in Python and JavaScript to optimise spatial analysis workflows and support urban regeneration work in the field.

CORE SKILLS

- Enterprise Geographic Information Systems (GIS) and Data Architecture
- Urban Regeneration Feasibility and Mathematical Allocation Models
- Data Processing and Automation with Python (ArcPy, Pandas)
- Custom Web-GIS Development with JavaScript (React.js, Three.js)
- Social Fabric Analysis and Property Owner Negotiations

EDUCATION

Dokuz Eylül University
Faculty of Architecture
City and Regional Planning
2015 - 2020

Developed projects at different scales on renewable energy, building typologies and urban climate.

WORK EXPERIENCE

Istanbul İmar A.Ş. November 2021 - July 2026

GIS Projects

Property Management Systems

Contributed to the architecture and development of an enterprise Web-GIS platform for managing institutional real estate portfolios, spatially analysing property data and digitising workflows.

Processed complex data from Excel, PDF and paper documents and transferred it into digital systems as part of digital transformation operations.

Helped design a scalable system that consolidates data from multiple companies and public bodies within a single database hierarchy, managed through role-based access.

Contributed to the analysis of parcels, properties, zoning status, planning decisions and project inventories through dynamic map layers.

Developed interactive dashboards and thematic analysis tools for fast, accurate management reporting, supported by map-, time- and attribute-based decision support.

Technologies: ArcGIS Pro, ArcGIS Enterprise 11.x, Esri REST API, JavaScript (ES6+), React.js, TypeScript, Node.js, Arcade

ArcGIS Experience Builder Custom Widget Architecture

Hierarchical Layer Manager: Developed a custom widget to freeze temporary data layers in the browser, improving the user experience.

Dynamic PDF Reporting: Designed a module that instantly generates reports from map views and analysis charts using an institutional template.

TKGM Integration: Built analysis tools that generate dynamic parcel query links from coordinate data.

Technologies: React.js, TypeScript, JavaScript (ES6+), Arcade

Open-Source Web-GIS and Custom Mapping Applications

Develop open-source Web-GIS portals and independent projects that enable spatial analysis of extensive Excel inventories directly in the browser, without proprietary licence dependencies.

Design advanced interactive web experiences and develop modern, well-designed interfaces for portfolio systems and data analysis workflows.

Technologies: React-Leaflet, OpenLayers, WebGL

Urban Regeneration and Property Owner Negotiations

Conducted multi-criteria feasibility studies for urban regeneration areas and helped develop mathematical valuation and fair allocation models based on property ownership and entitlement assessments.

Managed spatial data production and mapping for regeneration areas. Processed field survey data in Excel and contributed to social fabric analysis and demographic reporting.

Led direct discussions with property owners, maintained transparent information flows and actively participated in formal negotiation and contract processes.
